

GDPR Compliance Testing

Systems, Process, & Information Verification

It can be very difficult to close the loop on GDPR efforts, but there's more that can be done than just waiting anxiously for an unfortunate event to occur.

Let AppGlo directly confront the risk that your organization is exposed to and thoroughly test the systems, processes, & information that have been implemented in the course of all your GDPR compliance endeavors. Through this process we will expose any vulnerabilities or areas of concern.

AppGlo testing services provide dedicated and focused attention to your unique GDPR situation backed by years of experience in software quality assurance, product development and data security compliance professional services. With expertise and certification specific to GDPR, you can be sure that we will take the time to explain every finding thoroughly and empower you to follow the best course of action for your organization.

Our primary objective is to work with you to verify that your GDPR approach is functional, effective and compliant.

Upon request, we can also provide GDPR training or consulting services that are custom tailored to the specific needs of your organization.

Our process provides you with a trusted outside partner, who will take on the persona of a GDPR covered individual and rigorously test your site for non-compliance in four distinct phases:

- 1. Be Informed** – Tests include a thorough review of available privacy statements as well as data collection form tests for notification and consent.
- 2. Access Requests** – Tests request access to data held regarding the assumed persona and verify that protocol is being followed.
- 3. Rectification & Portability** – Tests request certain data corrections to be made and data to be transferred to a designated third party.
- 4. Erasure & Review** – Tests request erasure of data regarding the assumed persona and a complete review of the end to end process is then performed.
